Series of lectures:  
jeu de taquin and asymptotic representation theory

Piotr Śniady

plan for this series of lectures:  
representations of the symmetric groups  
 $\mathfrak{S}_1 \subset \mathfrak{S}_2 \subset \mathfrak{S}_3 \subset \dots$  and  $\mathfrak{S}_\infty$

## plan for this series of lectures:

### Lecture 1, August 30

what can we say about RSK  
applied to random input?

---

### Lecture 2, September 2

... and what does it tell us  
about the **asymptotic representation theory**  
of the symmetric groups  $\mathfrak{S}_n$  for  $n \rightarrow \infty$  and  $\mathfrak{S}_\infty$ ?

## plan for this series of lectures:

### Lecture 1, August 30

what can we say about RSK  
applied to random input?

### Lecture 2, September 2

... and what does it tell us  
about the **asymptotic representation theory**  
of the symmetric groups  $\mathfrak{S}_n$  for  $n \rightarrow \infty$  and  $\mathfrak{S}_\infty$ ?

# Lecture 1A: what can we say about RSK applied to random input?

Piotr Śniady

Polska Akademia Nauk

# RSK is a bijection...

## Input:

- word  $\mathbf{w} = (w_1, \dots, w_n)$

## Output:

- semistandard tableau  $P$ ,
- standard tableau  $Q$ ,

tableaux  $P$  and  $Q$  have the same shape with  $n$  boxes

example:

$\mathbf{w} = (23, 53, 74, 16, 99, 70, 82, 37, 41)$

74	99		
23	53	70	
16	37	41	82

insertion tableau  $P(\mathbf{w})$

8	9		
4	6	7	
1	2	3	5

recording tableau  $Q(\mathbf{w})$

## Lecture 1A: what can we say about RSK applied to random input?

RSK

RSK

RSK is a bijection...

RSK is a bijection...

Input:

word  $w = (w_1, \dots, w_n)$ 

Output:

semistandard tableau  $P$ ,standard tableau  $Q$ ,tableaux  $P$  and  $Q$  have  
the same size and shape

example:

 $w = (21, 53, 74, 18, 89, 71, 82, 37, 41)$ 

74	89		
21	53	74	
18	37	41	82

insertion tableau  $P(w)$ 

5	8		
4	8	7	
2	3	3	1

recording tableau  $Q(w)$ 

- start with empty tableaux  $P := \emptyset$ ,  $Q := \emptyset$ ;
- read the letters from the word  $\mathbf{w}$ , one after another;
- for each LETTER:
  - iterate over the rows of the insertion tableau  $P$ , start from the first row;
  - insert the LETTER to some box in this row as far to the right as possible, so that the row remains increasing;
  - was this box empty?
    - NO the previous tenant must be bumped!  
LETTER := bumped element;  
proceed to the next row;
    - YES update information about the new box into the recording tableau  $Q$ ,  
proceed to the next letter of the word;

→ ULAM 1963

# Plancherel measure

## exercise

if  $\mathbf{w} = (w_1, \dots, w_n)$  is either

- a random permutation, or
- iid sequence  $U(0, 1)$

then for each  $\lambda \in \mathbb{Y}_n$

$$\mathbb{P}(\overbrace{\text{RSKshape}(\mathbf{w})}^{\text{common shape of } P(\mathbf{w}) \text{ and } Q(\mathbf{w})} \text{ is equal to } \lambda) = \frac{(\text{number of SYT of shape } \lambda)^2}{n!} = \frac{(\dim \rho_\lambda)^2}{n!}$$

*'random irreducible component  
of the left regular representation  $\ell^2(\mathfrak{S}_n)$   
of the symmetric group'*

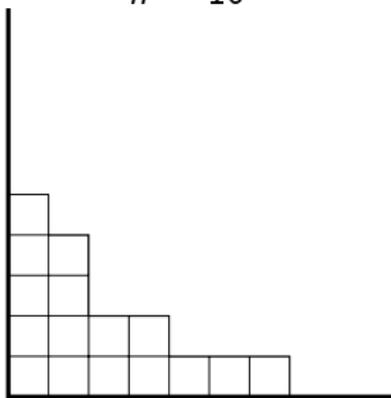

→ Lecture 2

## limit shape for Plancherel measure

### problem

what can we say about the common shape of  $P(\mathbf{w})$  and  $Q(\mathbf{w})$  when  $n \rightarrow \infty$  and  $\mathbf{w} = (w_1, \dots, w_n)$  is random?

$n = 16$

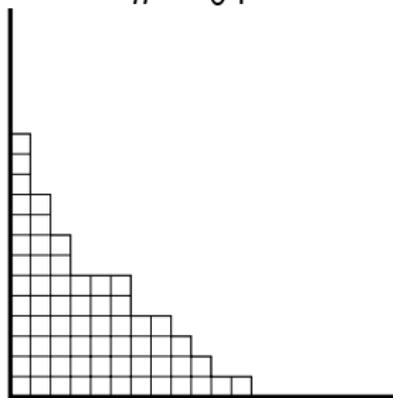

## limit shape for Plancherel measure

### problem

what can we say about the common shape of  $P(\mathbf{w})$  and  $Q(\mathbf{w})$  when  $n \rightarrow \infty$  and  $\mathbf{w} = (w_1, \dots, w_n)$  is random?

$n = 64$

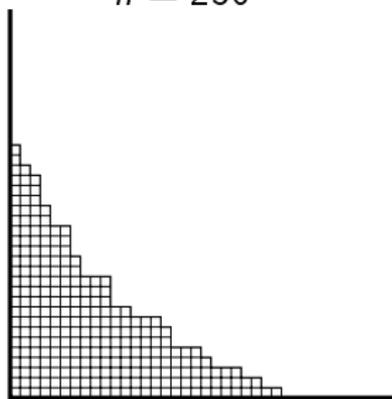

## limit shape for Plancherel measure

### problem

what can we say about the common shape of  $P(\mathbf{w})$  and  $Q(\mathbf{w})$  when  $n \rightarrow \infty$  and  $\mathbf{w} = (w_1, \dots, w_n)$  is random?

$n = 256$

## Theorem (LOGAN&SHEPP, VERSHIK&KEROV 1977)

*in the limit  $n \rightarrow \infty$*

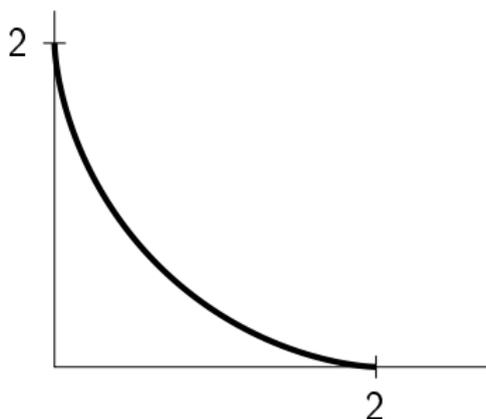

*RSKshape( $\mathbf{w}$ ) (=the common shape of  $P(\mathbf{w})$  and  $Q(\mathbf{w})$ )*

*after rescaling by the factor  $\frac{1}{\sqrt{n}}$*

*becomes (with very high probability)*

*very close to some concrete limit shape*

 \end{array}$$

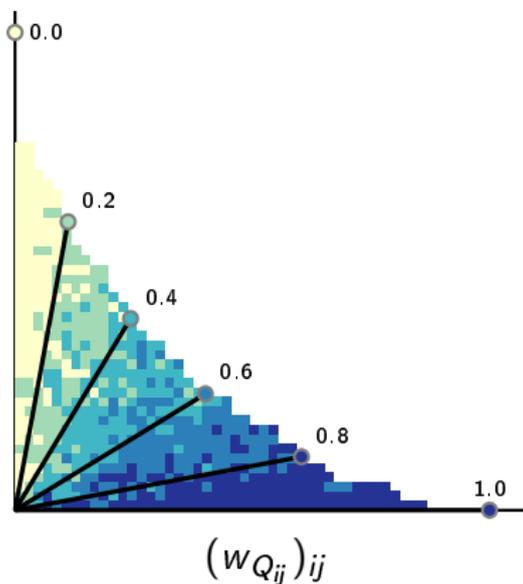

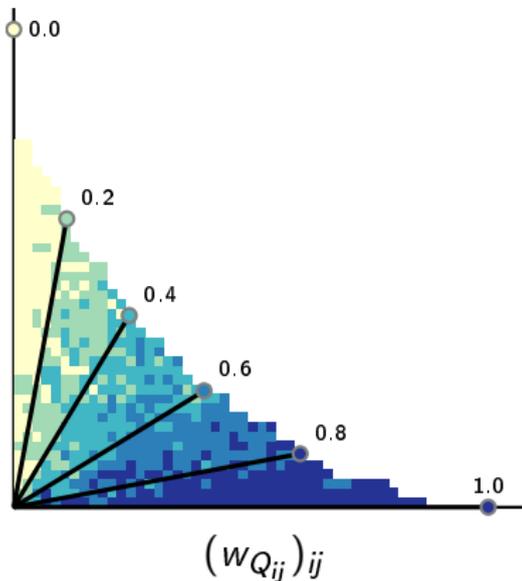

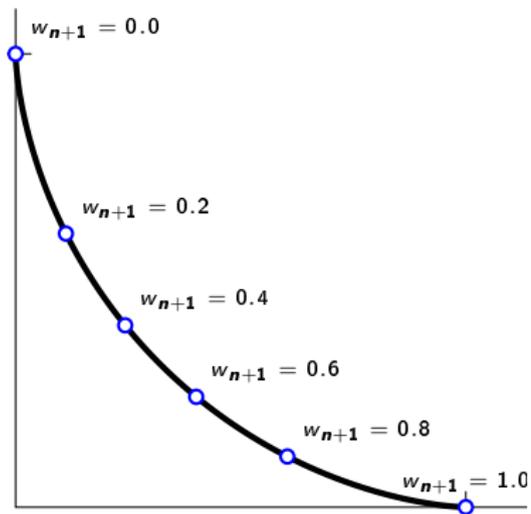

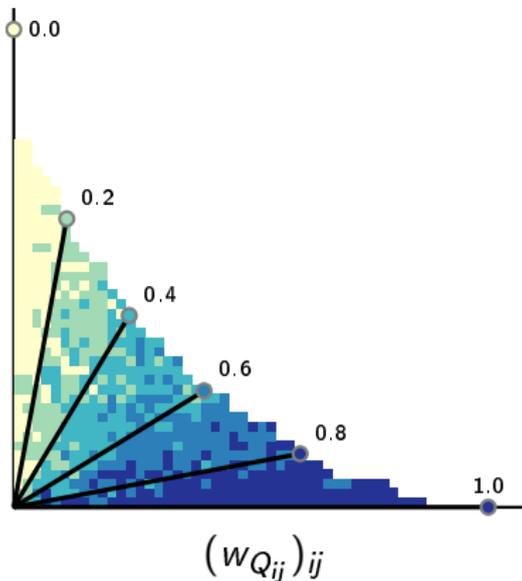

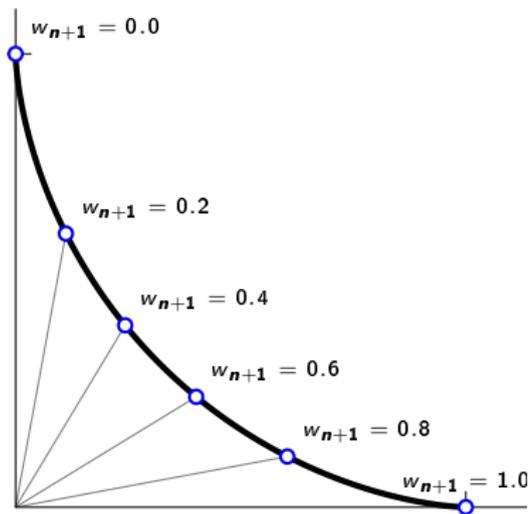

Theorem (ROMIK&ŚNIADY 2015)

$$\left\| \frac{\square}{\sqrt{n}} - (\text{RSK} \cos w_{n+1}, \text{RSK} \sin w_{n+1}) \right\| \xrightarrow[n \rightarrow \infty]{\text{in probability}} 0$$

Theorem (ROMIK&ŚNIADY 2015)

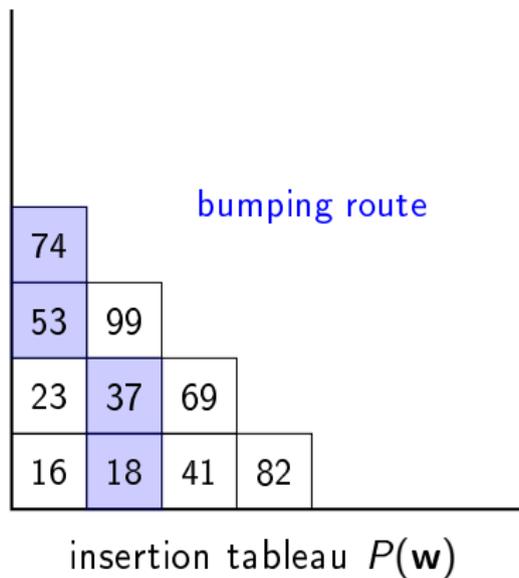

$$\left\| \frac{\square}{\sqrt{n}} - (\text{RSKcos } w_{n+1}, \text{RSKsin } w_{n+1}) \right\| \xrightarrow[n \rightarrow \infty]{\text{in probability}} 0$$

Theorem (ROMIK&ŚNIADY 2015)

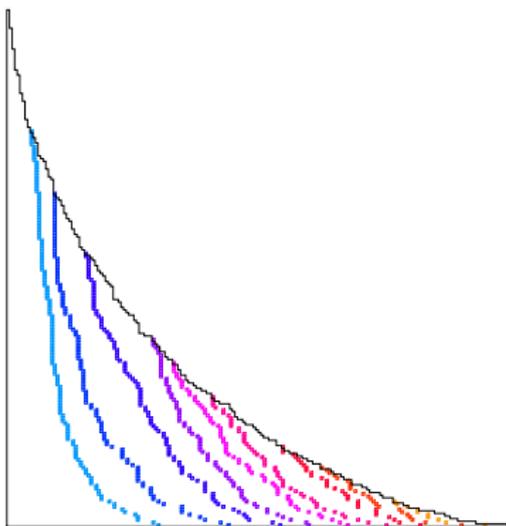

$$\left\| \frac{\square}{\sqrt{n}} - (\text{RSK} \cos w_{n+1}, \text{RSK} \sin w_{n+1}) \right\| \xrightarrow[n \rightarrow \infty]{\text{in probability}} 0$$

## bumping routes

$$\mathbf{w} = (23, 53, 74, 16, 99, 69, 82, 37, 41, \underbrace{18}_{w_n})$$

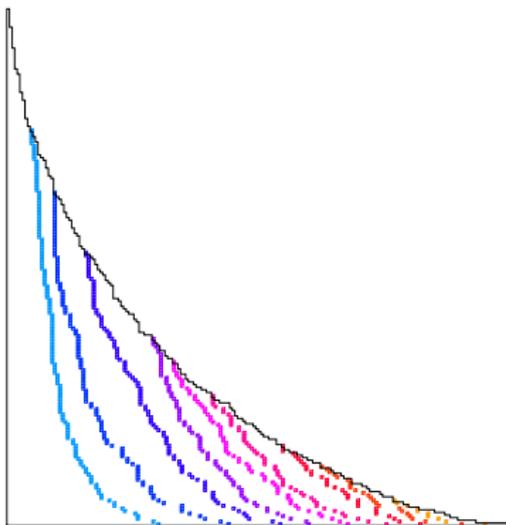

## bumping routes

problem → MOORE 2006

what can we say about the shapes of the bumping routes?

## bumping routes

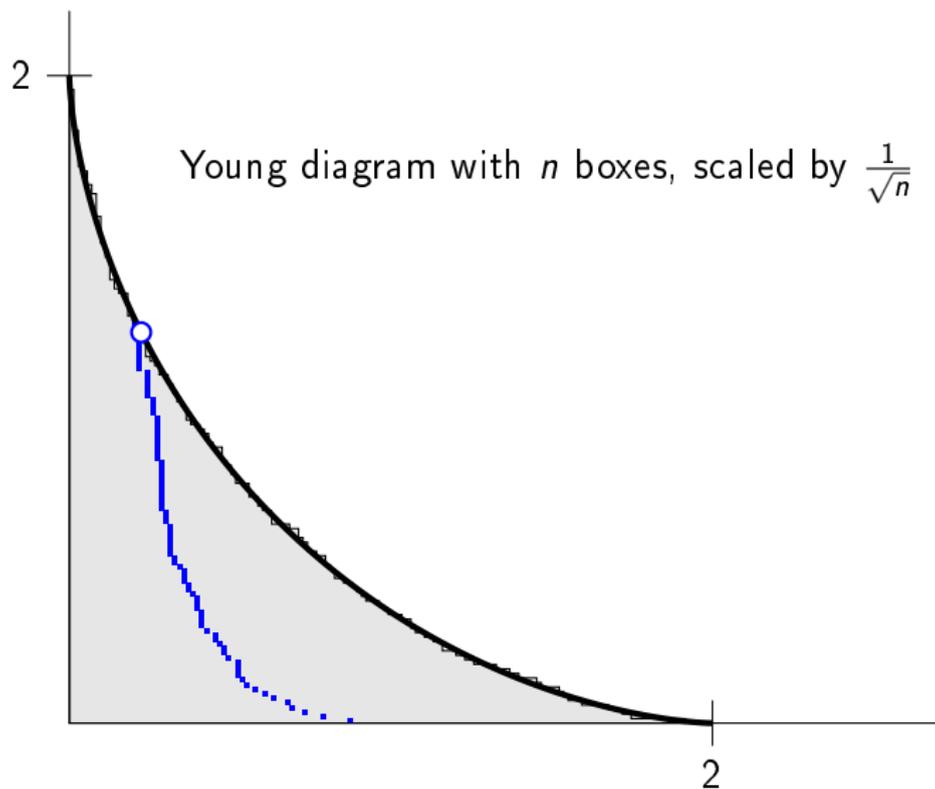

problem → MOORE 2006

what can we say about the shapes of the bumping routes?

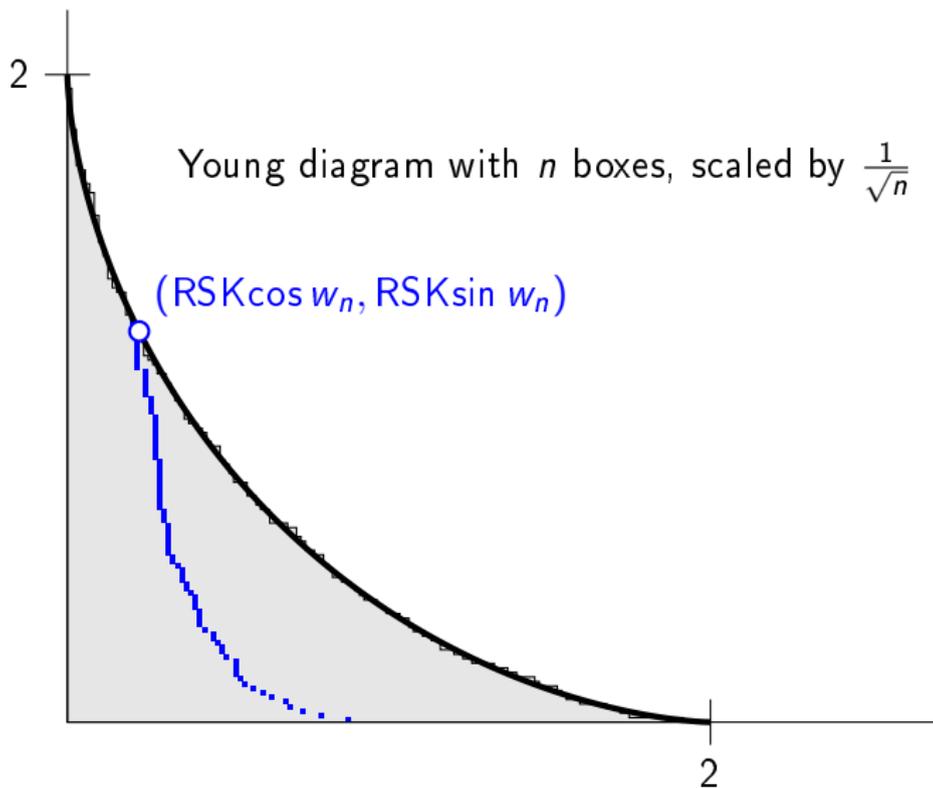

Theorem, ROMIK & ŚNIADY 2014

Bumping route (scaled by factor  $\frac{1}{\sqrt{n w_n}}$ )  
obtained by adding entry  $w_n$  to the tableau  $P_{n-1}$   
converges in probability (as  $n \rightarrow \infty$ ) to a deterministic curve  $G_T$ .

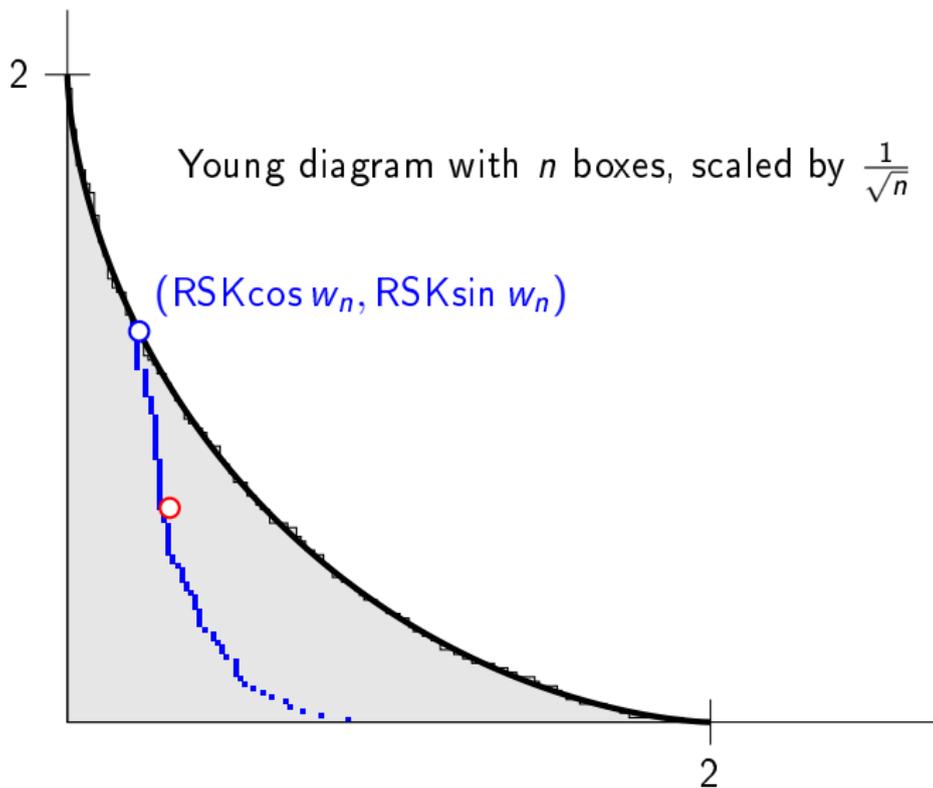

the key result explains the behavior of bumping routes

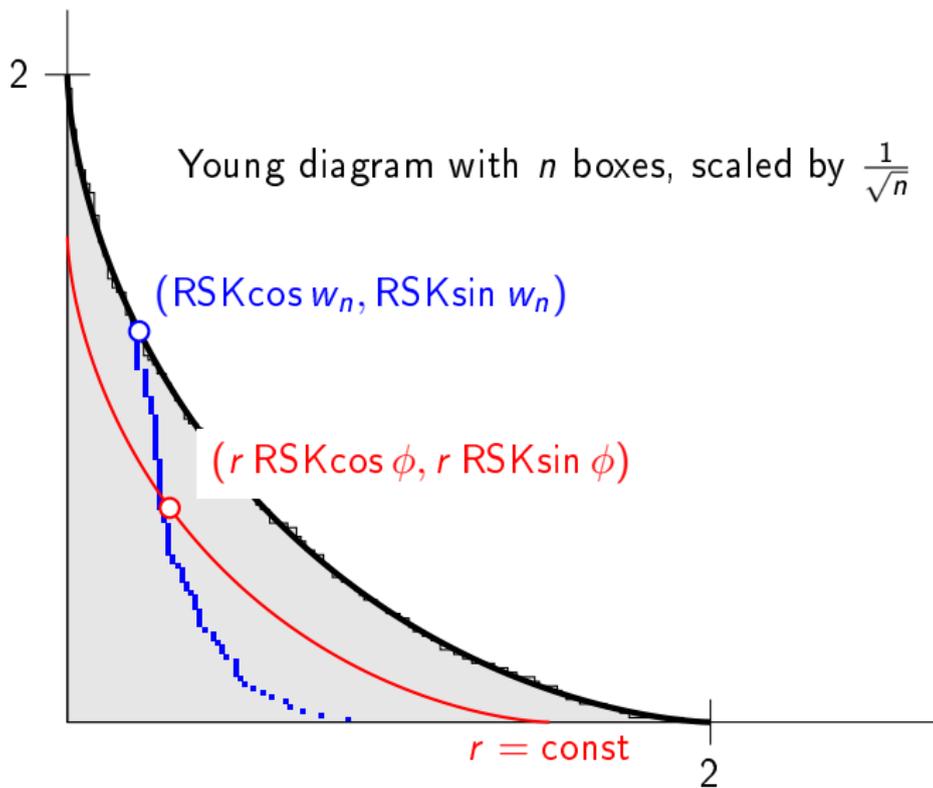

the key result explains the behavior of bumping routes

## diffusion of a box

- $\boxed{w_n}(P_m)$  denotes the location of the box containing  $w_n$  in the insertion tableau  $P_m = P(w_1, \dots, w_m)$ , for  $m \geq n$ ;

### problem

what can we say about the time evolution of  $\boxed{w_n}(P_m)$  for  $m = n, n + 1, \dots$ ?

# diffusion of a box

## diffusion of a box

- $w_n(P_m)$  denotes the location of the box containing  $w_n$  in insertion tableau  $P_m$ , for  $m \geq n$ ;

### Theorem (ŚNIADY, never published)

There exists an explicit function  $G : \mathbb{R}_+ \rightarrow \mathbb{R}_+^2$  such that

$$\frac{w_n(P_{\lfloor ne^\tau \rfloor})}{\sqrt{n} w_n} \xrightarrow[n \rightarrow \infty]{\text{in probability}} G_\tau \quad \text{for } \tau \geq 0.$$

## diffusion of a box

- $w_n$  ( $P_m$ ) denotes the location of the box containing  $w_n$  in insertion tableau  $P_m$ , for  $m \geq n$ ;

### Theorem (ŚNIADY, never published)

There exists an explicit function  $G : \mathbb{R}_+ \rightarrow \mathbb{R}_+^2$  such that

$$\frac{w_n(P_{\lfloor ne^\tau \rfloor})}{\sqrt{n} w_n} \xrightarrow[n \rightarrow \infty]{\text{in probability}} G_\tau \quad \text{for } \tau \geq 0.$$

### exercise

prove this result using 'asymptotic determinism of last box insertion'

Hint: if  $\mathbf{w}$  is a permutation and  $\text{RSK}(\mathbf{w}) = (P, Q)$  then  $\text{RSK}(\mathbf{w}^{-1}) = (Q, P)$ .

# hydrodynamic limit of RSK

## hydrodynamic limit of RSK

Theorem (ŚNIADY, never published)

There exists an explicit function  $G : \mathbb{R}_+ \rightarrow \mathbb{R}_+^2$  such that

$$\frac{w_n(P_{\lfloor ne^\tau \rfloor})}{\sqrt{n} w_n} \xrightarrow[n \rightarrow \infty]{\text{in probability}} G_\tau \quad \text{for } \tau \geq 0.$$

## hydrodynamic limit of RSK

### Theorem (ŠNIADY, never published)

There exists an explicit function  $G : \mathbb{R}_+ \rightarrow \mathbb{R}_+^2$  such that

$$\frac{\boxed{w_n}(P_{\lfloor ne^\tau \rfloor})}{\sqrt{n} w_n} \xrightarrow[n \rightarrow \infty]{\text{in probability}} G_\tau \quad \text{for } \tau \geq 0.$$

### exercise

- the above theorem concerns movement of a **single** particle; what can we say about **collective** movement of the fluid particles?  
if we consider **transformations of the quarterplane** describing the time-evolution of the insertion tableau  $P$ : in which topology the convergence holds true?
- write a paper about it, add ŠNIADY as coauthor if you like,
